Statistical Study of Mobile Phone Usage Among College Students

MURALI KRISHNAN N (192524090) B.TECH AI & DS , SIMATS ENGINEERING , CHENNAI COURSE : FUNDAMENTAL DATA SCIENCE COURSE CODE : DSA0405 GUIDED BY : KRISHNARAJ M

Introduction

Problem: How does daily mobile phone use relate to academic performance, sleep, and wellbeing?

Survey College Students → Statistical Analysis

Why it matters: near-universal smartphone use; links to sleep, focus & mental health; informs digital wellbeing policy.

Methodology

Survey Design → Data Cleaning → Descriptive Statistics → Correlation & Regression

Pearson correlation; multiple linear regression; normality testing (Shapiro-Wilk); α = 0.05.

Screen Time vs Sleep: $r = -0.41$ | Significance: $p < .001$

Conclusion

1. Higher screen time is moderately associated with reduced sleep.
2. Social media + messaging form the largest usage share.
3. Lower GPA bands show modestly higher screen time.

Future Directions

- Expand to multiple institutions.
- Use passive app-tracking data.
- Use longitudinal designs.
- Test wellbeing interventions.

Dataset & Sample

Anonymous online survey of undergraduates: screen time, app category, sleep hours, and academic self-rating.

412 Respondents • 4 Class Years • 18 Majors • 3 Weeks

Illustrative sample data — replace with actual survey results.
